Most significantly, pollution has become a new territory during the last forty years, and 90 percent of epidemiologists expect that one of them will create a disastrous, deadly pandemic sometime in the next two generations. To reveal just how that might happen, Sonia Shah tracks each of cholera’s dramatic journey from harmless microbe to world-changing pandemic, from its 1817 emergence in the South Asian hinterlands to its rapid dispersal across the nineteenth-century world and its latest beachhead in Haiti. She reports on the pathologies following in cholera’s footsteps, from the MRSA bacterium that besieges her own family to the now-fearlessly killed emerging from China’s wet markets, the surging waves of New Delhi, the slums of Port-au-Prince, and the suburban backyards of the East Coast. By delving into the convoluted science and politics of the one of the most deadly diseases, Pollution reveals what the next epidemic might look like and what we can do to prevent it.
